

Front-End Evaluation

Your Task

Please build 2 components of your choice, illustrated in the attached PSD. The results should work in all major standard browsers and devices, and should incorporate presentation layer best practices.

At least one component (of your choice) must include some sort of user interaction with JS (click handler, show/hide things)

Use your creativity to bring the UI to life by implementing animations or other cool effects.

Optional: Create a JSON file to provide content for your components

Technology

- Angular7 or Vanilla JavaScript
- CSS / SASS
- HTML
- Git

Best Practices

- Comment your code cleanly and concisely
- Make use of semantic HTML to provide clear communication of content use
- Follow [ABEM](#) CSS class naming conventions
- Create appealing interaction and styling for components (hover, animations, transitions)
- Consider responsive needs of the users (desktop, tablet, mobile)
- Make sure your components follow accessibility standards (WCAG Level A and/or AA)

Delivery

When finished, please host your files on GitHub (or other Git hosting) and provide us with a link to your repository. Please include instructions on how to run your project.
